

How to make an outgoing call using Ajura?

If an Ajura user has access to data (2G, 3G, 4G or Wi-Fi), he can use **Ajura Out** option to make calls. In this process, he needs to bear nominal call charges.

If an Ajura user has a slow internet connection, he can use **GSM Callback**. In this process, when the caller dials any number, he will receive a call from the server which will connect his call to the recipient.

In case the internet is not available, the user should go for **GSM Callout** option. A call will be generated from the user's SIM and dialed to a number from where the call will be connected to the destination. This service is available in **selected countries** only.
